Developed software

DISTANCEGEOMETRY (**GitHub repository:** <https://github.com/mucherino/DistanceGeometry>)

This is a recent repository (opened at the beginning of 2023) that aims at collecting various software tools developed in the context of distance geometry and related disciplines. The very first tool that is deposited in this repository is the Java program named *javaCMP* that implements some basic functions related to the newly introduced *Coherent Multi-representation Problem*. This problem was recently proven to be an extension of the “traditional” Distance Geometry Problem (DGP) [45].

In the near future, instead of creating new repositories for each new software project, new directories will be added to this unique repository, for the final users to have an easier access to all developed tools.

MD-JEEP (**GitHub repository:** <https://github.com/mucherino/mdjeep>)

This is an implementation in C of the Branch & Prune (BP) algorithm for solving discretizable DGPs [17, 20, 22]. MD-JEEP is the result of a strong collaboration among myself, Leo Liberti, Carlile Lavor, Douglas Gonçalves, Jung-Hsin Lin, Nelson Maculan, and other people. The details regarding the discretization of the DGP and the BP algorithm can be found in our publications. MD-JEEP is distributed under the GNU General Public Licence (v.3), and it is available on GITHUB since the version 0.3.0. Details about the first release of MD-JEEP can be found in [77]. Details about the latest releases can be found in [51,53,54]. Thanks to the feedback received from various students and colleagues, quite a few fixes were recently pushed on the repository. A new version of MD-JEEP is currently under development.

BINMETA (**GitHub repository:** <https://github.com/mucherino/binMeta>)

This Java project intends collecting, in one unique Java package, several meta-heuristic searches that have been proposed over the last years for the solution of combinatorial optimization problems. This project has actually started as a simple student project, but it has subsequently grown to a more important project, where two commits in particular are related to recent advances published in conference proceedings [42,48].

Other software

- A tool for feature selection that is based on consistent biclustering [94]. This tool is written in AMPL and invokes CPLEX for the solution of the inner problem arising in our bilevel reformulation [130], which is linear. The tool can be made available upon request.
- An implementation in C programming language of the Monkey Search Meta-Heuristic. This implementation can be made available upon request.

Languages

- Italian: mother tongue.
- English: excellent spoken and written.
- French: good spoken and written.
